

GlobeBudget

Feature Prioritization (RICE Framework)

Overview

The RICE framework was used to prioritize GlobeBudget features based on Reach, Impact, Confidence, and Effort. This methodology helps identify which features should be included in the Minimum Viable Product (MVP) and which should be planned for future releases.

RICE Formula

$$\text{RICE Score} = (\text{Reach} \times \text{Impact} \times \text{Confidence}) \div \text{Effort}$$

Reach: Number of users affected by the feature.

Impact: Expected effect on user experience and business goals.

Confidence: Level of certainty in the impact estimate.

Effort: Development resources and time required.

Feature	Reach	Impact	Confidence	Effort	RICE Score	Priority
Expense Tracking	9	10	9	3	270	High
Budget Management	8	9	8	4	144	High
Currency Converter	7	8	8	3	149	High
Spending Analytics	6	8	7	5	67	Medium
Emergency Fund Tracker	5	7	8	4	70	Medium
AI Financial Coach	4	9	5	9	20	Low

Prioritization Summary

High Priority Features

- Expense Tracking
- Budget Management
- Currency Converter

Medium Priority Features

- Spending Analytics
- Emergency Fund Tracker

Low Priority Features

- AI Financial Coach

Key Product Insight

Expense Tracking and Budget Management received the highest priority because they directly address the core financial challenges faced by international students. Advanced features such as AI Financial Coaching were intentionally deprioritized due to higher implementation effort and lower necessity for the initial MVP.

Recommendation

The MVP should focus on delivering a seamless expense tracking and budgeting experience. Features such as spending analytics and emergency fund tracking can be introduced in later releases, while AI-powered financial guidance should be considered a long-term enhancement.
